

Admin Portal Manual

2026-05-04

Admin Portal

The operator's daily driver — customer management, sales pipeline, revenue dashboard, license issuance, threat-intel triage, support inbox, system health.

URL

`https://admin.preston-check.com/`

Mirror at `https://preston-check-admin.pages.dev/` (same content, also gated by the same Cloudflare Access policy).

Auth

Cloudflare Access — operator email + 6-digit PIN sent via email. 24-hour session. Configured in Cloudflare Zero Trust → Access → Applications → "Preston-Check Admin".

To add or change allowed emails: Zero Trust dashboard → Access → Applications → Preston-Check Admin → Edit policy → "Operator only". Save.

The eight surfaces

Customers (`#/customers` , default route)

Master list of every paying organization. Sort by MRR. Spot-check churn-risk pills. Filter by plan / status. Click any row to open the customer detail panel (repos, scan history, billing, support tickets).

KPI tiles: active customers, Pro count, Enterprise count, churn-risk-red count.

Sales ([#/sales](#))

Five-column kanban: Lead → Qualified → Demo → Trial → Closed-won. Drag cards between stages. Pipeline ACV / weighted forecast / win rate / avg cycle time KPIs at the top.

Sources tracked: Inbound (free-tier signup), GitHub Action installs, Slack mentions, direct email, referrals.

Revenue ([#/revenue](#))

The CFO view. MRR / ARR / NRR (TTM) / Gross margin tiles. 12-month MRR bar+line chart. Revenue waterfall (starting MRR + new + expansion + reactivation – contraction – churn = ending MRR). Eight-month cohort retention heatmap.

Stripe is source of truth; this surface mirrors for fast queries and offline drill-down. Reconciliation is nightly.

Users ([#/users](#))

Every individual user across every customer org. Filter by org, role, last login, 2FA status. Stale accounts (no login > 30 days) flagged. Suspend / unlock / reset-password actions. Audit log captures every admin action.

Licenses ([#/licenses](#))

Issued license table with Ed25519 fingerprints. Tier pills (TRIAL / PRO / ENT). Issue / expiry dates. Renew / Revoke actions.

License issuance triggers a hardware-token prompt on the operator's local machine (the signing key never leaves it). Until the UI is fully wired, issuance happens via `tools/issue-license.sh` from the operator's terminal — see `docs/manuals/administrator-manual.md` "Issuing a license".

Threat-Intel ([#/threat-intel](#))

Triage queue for the weekly NVD ingest. Each row is a candidate check awaiting maintainer pattern authoring. Columns: CVE ID, fintech-relevance score, languages affected, draft check link, status (pending / accepted / rejected / promoted).

Click "Author pattern" to drop into a Monaco-style editor with live regex tester against a fixture corpus. Promote to `checks/community/accepted/` with one button.

Support (`#/support`)

Ticket inbox. P0 / P1 / P2 priority pills. SLA timer per ticket (median TTFR shown as a KPI). AI draft response is gated — never auto-sent.

Sources: email to `support@preston-check.com`, Slack thread → ticket slash command, customer-portal submitted tickets.

System (`#/system`)

Operational pulse. Nine health-tile board covering: API, customer portal, telemetry endpoint, D1, KV, Stripe webhook, threat-intel cron, Docker Hub, Homebrew tap.

Build attestation panel at the bottom: tag, tarball name, SHA-256, who published, signing key fingerprint, distribution channels. The panel customers' auditors will ask about.

How to navigate

Hash-routed SPA. Every surface is reachable via a permalinkable URL:

- `#/customers` (default)
- `#/sales`
- `#/revenue`
- `#/users`
- `#/licenses`
- `#/threat-intel`
- `#/support`
- `#/system`

Top bar has a search field (placeholder for future ⌘K-shortcut), notifications bell with unread dot, and operator pill (your avatar + name + role).

Source

`web/admin/` in the public repo:

<code>web/admin/index.html</code>	single-page app shell with eight sections in DOM
<code>web/admin/styles.css</code>	operator-density layer on the landing-page tokens
<code>web/admin/app.js</code>	hash router + customer-table renderer

web/admin/README.md
web/admin/DEPLOY.md

local-preview notes
Cloudflare Pages + Access setup walk-through

Hosted on

Cloudflare Pages, project name `preston-check-admin`. Auto-deploys from `web/admin/` on every master push that touches the source. Custom domain `admin.preston-check.com` bound via Pages dashboard. Cloudflare Access policy gates ingress.

How to update

Edit any file under `web/admin/` and push to master. The `admin-pages.yml` workflow auto-deploys within 60-90 seconds.

To preview locally (no Access gate, mock data only):

```
cd web/admin
python3 -m http.server 8081
# open http://localhost:8081/
```

To deploy manually:

```
gh workflow run admin-pages.yml --repo preston-check/preston-check
```

Status

Skeleton with mock data. The clickable shell is live behind Access and demonstrates every surface, but no real customer data flows through it yet. The production wiring (impersonation, real-time KPIs from Stripe + D1, license issuance via Touch ID, threat-intel in-app authoring) lands per the Q4 2026 build sequence in `docs/commercial-roadmap.md`.

Production roadmap

Q4 2026 turns the skeleton into the operator's real daily driver:

1. **Stripe webhook integration** — Customers/Revenue tabs reflect reality, not mock JSON

2. **License issuance UI** — Touch-ID-prompted hardware signing replaces the terminal `tools/issue-license.sh` flow
3. **Threat-intel authoring editor** — Monaco editor with regex tester + corpus runner; promote drafts with one button
4. **Support ticket integration** — email + Slack ingest, SLA timers, AI draft responses (still gated)
