

Customer Portal Manual

2026-05-04

Customer Portal

The SaaS dashboard where paying customers (Pro, Enterprise) consume scanner output and produce auditor-ready deliverables.

URL

`https://app.preston-check.com/`

Mirror at `https://preston-check-customer.pages.dev/` (Cloudflare's internal Pages URL — always reachable).

Status

Skeleton with mock data. The clickable shell is live and demonstrates every surface, but no real customer data flows through it yet. The production wiring (auth, billing, scan-result ingestion, license issuance) lands per the Q3 2026 build sequence in `docs/commercial-roadmap.md`.

The five surfaces

Home (`#/home` , default route)

Score-as-hero panel: the customer's current letter grade (A–F) and numeric score in a navy-emerald gradient panel. Below it: four KPI tiles, a 90-day score sparkline, top-2 critical findings preview, framework-coverage progress bars across PCI-DSS / SOC 2 / MiCA / OWASP API.

The score-as-headline pattern is the single most underrated UX move in security tooling — see `docs/strategy/moat-strategy.md`.

Repos ([#/repos](#))

Connected-repository list with one row per repo. Columns: name, language, current letter grade (color-coded chip), critical/high finding pills, last-scan timestamp, 30-day mini-sparkline trend. Click any row to drill into the repo's findings + scan history.

Findings ([#/findings](#))

Per-finding cards across the entire org. Each card shows:

- Severity badge + check ID + name
- Filename, line number, code excerpt
- AI assessment in an emerald-themed inline panel — confidence score, classification (real / likely-false-positive / needs-review), plain-English explanation
- Suggested unified-diff patch with syntax-highlighted +/- lines (when `--ai-fix` is enabled in the scanner)
- Two action buttons: "False positive" (feeds AI training set) and "Apply patch"

Demonstrates the AI moat in the surface where customers actually feel it.

Compliance ([#/compliance](#))

Framework-control rollups. Pick PCI-DSS, SOC 2, ISO 27001, MiCA, DORA, NIST CSF, or any of the 33 frameworks; see per-control pass/fail status across all repos. The "Generate audit pack" button produces a PDF + ZIP bundle mapped to the framework's control catalog.

This is the deliverable that justifies Pro/Enterprise pricing — the auditor-ready handoff.

Settings ([#/settings](#))

Sub-pages: Organization (name, logo for branded PDFs, primary color), Team (invite by email, roles: Owner / Admin / Auditor / Member), Billing (Stripe-hosted subscription), License (regenerate, revoke), API tokens (one-time-shown, scoped), Notifications (Slack webhook, email digest, threshold alerts), Data export.

How to navigate

Hash-routed SPA — every surface is reachable via a permalinkable URL:

- <https://app.preston-check.com/#/home>
- <https://app.preston-check.com/#/repos>
- <https://app.preston-check.com/#/findings>

- `https://app.preston-check.com/#/compliance`
- `https://app.preston-check.com/#/settings`

The left rail is sticky on every surface. Org switcher in the top bar lets the operator (you, when impersonating) jump between customer accounts; for actual customers it shows their org only.

Source

`web/customer/` in the public repo:

<code>web/customer/index.html</code>	single-page app shell with five sections in DOM
<code>web/customer/styles.css</code>	design system layered on the landing-page tokens
<code>web/customer/app.js</code>	hash router (no innerHTML; safe DOM APIs only)
<code>web/customer/functions/</code>	Cloudflare Pages Functions (server-side)
<code> api/v1/telemetry/index.ts</code>	telemetry ingest endpoint
<code>web/customer/_routes.json</code>	locks <code>/api/*</code> to Functions, no static fallback

Hosted on

Cloudflare Pages, project name `preston-check-customer`. Auto-deploys from `web/customer/` on every master push that touches the source. Custom domain `app.preston-check.com` bound via the Pages dashboard.

How to update

Edit any file under `web/customer/` and push to master. The `customer-pages.yml` workflow auto-deploys within 60-90 seconds.

To preview locally:

```
cd web/customer
python3 -m http.server 8082
# open http://localhost:8082/
```

To deploy manually:

```
gh workflow run customer-pages.yml --repo preston-check/preston-check
```

Production roadmap

Q3 2026 brings the four production wires that turn the skeleton into a real product:

1. **Magic-link auth** — passwordless login via email PIN, same Cloudflare-Access-style mechanism the admin portal uses
2. **Stripe billing** — subscription tier selection, plan upgrades, self-serve cancellation, invoices
3. **Scan-result ingestion** — POST endpoint that accepts the scanner's report.json from a CI run, stores it under the customer's org, displays in /repos and /findings
4. **License issuance** — operator triggers a license issue from the Admin Portal; customer sees the new license in /settings and can download it as a `.license` file

Each of these is documented in `docs/portals-and-kpis.md` (Customer Portal section) and on the build sequence in `docs/commercial-roadmap.md`.
