

Public Landing Page Manual

2026-05-04

Public Landing Page

The marketing surface and the first impression every prospective customer, partner, or journalist gets.

URL

`https://preston-check.com/`

Mirror at `https://preston-check.github.io/preston-check/` (always reachable even if the custom domain has a cert issue).

What it is

A static, single-page, long-scroll narrative. Eight sections: hero with score-badge mock, three pillars, terminal demo, nine-feature grid, 33-framework pill strip, three-tier pricing table, origin story with stats, final CTA + footer.

Zero JavaScript at launch. Zero CDN dependencies. Renders entirely from disk on a plain HTTP server. Loads under 50KB total.

Hosted on

GitHub Pages. The custom domain `preston-check.com` is bound via a CNAME file inside the deploy artifact + apex A records pointing at GitHub Pages IPs in Route 53.

Source

`web/landing/` in the public repo:

web/landing/index.html	single-page narrative
web/landing/styles.css	design system (color tokens, type scale, components)
web/landing/icons/currentColor)	16 proprietary SVG icons (24x24, 1.6px stroke,
web/landing/assets/	logomark, wordmark, score badge, diamond watermark
web/landing/CNAME	"preston-check.com" – Pages picks this up

How to update

Edit `web/landing/index.html` (or `styles.css`, `icons/`, `assets/`) and push to master. The `pages.yml` workflow auto-deploys on every push that touches `web/landing/**`. Site updates within 60-90 seconds of merge.

To preview locally:

```
cd web/landing
python3 -m http.server 8080
# open http://localhost:8080/
```

Design system

Documented in detail at `docs/website-design.md`. Three rules:

1. **Reuse the design tokens** from `styles.css` (–ink, –paper, –accent etc.) — never introduce a new color
2. **New icons get drawn from scratch** in the same style (24x24, 1.6px stroke, `currentColor`, recurring diamond-facet motif) — never import from a third-party library
3. **Editorial tone** — declarative sentences with subjects and verbs, no headline-speak, no marketing-fluff superlatives

When to update

- New product feature ships → add to the nine-feature grid
- Pricing tier changes → update the pricing table (and propagate to the customer portal's Settings → Billing surface)
- New framework added → append to the framework pill strip
- Annual State of Fintech Security report ships → header banner linking to it for the first 30 days

Analytics

Cloudflare Web Analytics (privacy-respecting, no cookies) — not yet enabled. To enable: Cloudflare dashboard → Web Analytics → add `preston-check.com` as a site, paste the resulting snippet into `index.html` before `</body>`. Ten minutes to wire.
