

Preston-Check

Pre-deployment security audit for fintech, narrowed and curated

2026-05-04

Preston-Check

294 hand-curated security checks across 33 reputable frameworks. Open source. Your code never leaves your machine.

Pre-deployment security tools have a quality problem: scanners that try to cover every domain end up covering none of them well. Preston-Check is fintech-narrow on purpose — the catalog is 294 checks built from real production audits, not 50,000 generic patterns crawled from public repos. Lower noise. Higher signal. Faster scans. Cleaner reports your auditor will actually read.

What it covers

DOMAIN	FRAMEWORKS
Card payments	PCI-DSS v4.0 · PCI 3DS · EMVCo 3DS 2.x
EU finance	MiCA (2024) · TFR · PSD2 · DORA (2025)
US finance	NYDFS Part 500 · FinCEN 31 CFR · OFAC SDN
APAC	MAS TRM · APRA CPS 234 · RBI CSF
AML / sanctions	FATF Recommendations 2023 (incl. Travel Rule)
General security	SOC 2 (TSC 2017) · ISO 27001:2022 · ISO 22301:2019
OWASP families	API Top 10 · Top 10 · Mobile MAS · LLM · Smart Contract
US framework	NIST CSF 2.0 · FIPS 203/204/205 (post-quantum) · SSDF 1.1

DOMAIN	FRAMEWORKS
Crypto custody	CCSS v9.0
Cyber benchmarks	CIS Controls v8

Each check cites the framework control it stems from and (where applicable) the real-world incident that motivated it. Wormhole bridge. Cetus integer overflow. Beanstalk Farms governance attack. The catalog is the post-mortem turned into automated regression tests.

What makes it different

Curated, not crawled. 294 checks where each has a name, a story, and a citation. Not 50,000 patterns scraped from public repos.

AI auto-fix. Pass `--ai-fix` and every finding comes with a suggested unified-diff patch. Apply with `git apply`, ship the fix.

Privacy-first. Open-source scanner. Telemetry is opt-in. `--airgap` blocks every outbound call. The privacy promise is auditable in 30 lines of bash.

One surface, every CI. Same exit codes and the same Markdown report whether you run it as a CLI, GitHub Action, GitLab CI job, CircleCI step, Docker image, Homebrew install, or pre-commit hook.

Compliance evidence bundles. Filter by framework, generate a PDF mapped to the control catalog, hand it to your auditor.

How it works

```
brew trust --tap preston-check/tap
brew install preston-check/tap/preston-check
preston-check --high-and-up --ci --report security-audit.md
```

A typical fintech codebase scan completes in 30 seconds to 3 minutes depending on size and severity filter. The report is plain Markdown plus a PDF version, with three-tier triage (FAIL must fix, WARN review, PASS / SKIP for context). Drop into your CI; fail the build on any critical finding.

Pricing

	FREE	PRO	ENTERPRISE
Price	\$0, no signup	\$999/repo/yr or \$4,999/yr unlimited	\$29,999+/yr
Catalog	All 294 checks	All 294 checks	All 294 checks + custom
AI augmentation	Bring your own API key	Bring your own API key	Bring your own API key
Markdown + local PDF reports	✓	✓	✓
Branded PDF reports	—	✓	✓
Multi-repo dashboard	—	✓	✓
Compliance evidence bundles	—	✓	✓
SSO (SAML / OIDC)	—	—	✓
White-label dashboards	—	—	✓
Custom check authoring	—	—	✓
SLA-backed support	—	—	✓
On-premise deployment	—	—	✓

OSS exemption — repositories with a recognized open-source license automatically get free Pro tier. Public security work makes the community stronger; a fintech maintaining an open-source library shouldn't pay to scan it.

Why now

The fintech security landscape has gotten harder, not easier. MiCA (EU 2024) and DORA (EU 2025) just landed. NYDFS Part 500 amendments expanded MFA scope in 2023. Travel Rule enforcement is now active across G20 jurisdictions. OWASP shipped a Smart Contract Top 10 in 2025. The FATF

Recommendations got a substantial update.

Most security tools haven't caught up. We have. Preston-Check ships a weekly threat-intel auto-ingestion pipeline that drafts new checks from CVE feeds and recent breaches, so the catalog grows faster than humans alone can write it.

Ready to start

```
curl -fsSL https://get.preston-check.com/install.sh | sh
prestion-check
```

Free forever. No signup. No telemetry by default. Apache 2.0.
