

Preston-Check Public Website — Design Spec

Visual system, iconography, and content architecture for preston-check.com

Preston-Check Maintainers

2026-05-04

Public Website Design Spec

The landing page lives at `web/landing/`. It is a static, single-file implementation: one `index.html`, one `styles.css`, an `assets/` folder for the brand mark and watermark, and an `icons/` folder for the proprietary icon set. Zero CDN dependencies, zero third-party icon libraries, zero JavaScript at launch. Everything renders from disk on a plain HTTP server.

Brand fundamentals

Name and persona

Preston-Check. Hyphen-cased. Wordmark uses a middle-dot separator ("Preston·Check") in display contexts where the hyphen reads heavy. Persona: rigorous, fintech-grade, friendly-but-serious. The product is an audit tool — confidence and calm beat hype.

Color tokens

TOKEN	HEX	USAGE
<code>--ink</code>	<code>#0B1F3A</code>	Deep navy. Primary text, brand mark, dark sections.
<code>--paper</code>	<code>#FFFFFF</code>	Default surface.
<code>--paper-2</code>	<code>#F8FAFC</code>	Raised surface (cards, alt sections).
<code>--rule</code>	<code>#E2E8F0</code>	Hairlines, dividers, default borders.

TOKEN	HEX	USAGE
<code>--mute</code>	<code>#475569</code>	Secondary text (body copy in muted contexts).
<code>--mute-2</code>	<code>#94A3B8</code>	Tertiary text (captions, eyebrow).
<code>--accent</code>	<code>#10B981</code>	Brand emerald. Score, PASS, brand accents.
<code>--accent-2</code>	<code>#2563EB</code>	Action blue. Used sparingly for non-brand links.
<code>--warn</code>	<code>#F59E0B</code>	WARN findings.
<code>--bad</code>	<code>#DC2626</code>	FAIL / critical.

Single-axis brand color (emerald). Action blue is restricted to inline text links so the page reads as a two-color system at glance. The deep navy carries the heavy aesthetic load — backgrounds, text, the brand mark — which is intentional: navy + emerald is the financial-services trust palette without being literally bank-blue.

Typography

System-stacked. No web font loads.

- **Headings** — `ui-serif, Georgia, "Times New Roman", serif`. The serif at large display sizes signals editorial seriousness. Modern Mac/iOS users get New York; modern Windows users get Cambria; fallback is Georgia. All four are quality serifs.
- **Body** — `ui-sans-serif, system-ui, -apple-system, "Segoe UI", "Helvetica Neue", Arial, sans-serif`. Legible at 18px body, scales gracefully.
- **Mono** — `ui-monospace, "SF Mono", Menlo, Consolas, monospace`. For terminal blocks and code excerpts.

Modular type scale at 1.250 (major third) anchored on 18px body: 14 / 18 / 22 / 28 / 36 / 44 / 56. Hero h1 sits at 56px desktop, 40px mobile. Body line-height is 1.6. Headings tighter at 1.05 (h1) to 1.3 (h3) for the editorial cadence.

Iconography — proprietary set

Sixteen custom SVG icons live at `web/landing/icons/`. Every icon is:

- **24x24 viewBox**, with all artwork inside the visible area.
- **1.6px stroke**, `currentColor`, `stroke-linecap="round"`, `stroke-linejoin="round"`. Inherits theme color from CSS.

- **No fill** unless intentionally solid for emphasis (the brand mark uses an emerald-filled facet on top of the navy shield).
- **Geometric and slightly rounded.** Avoids the over-smooth cartoony look of consumer-app sets and avoids the wireframe austerity of open-source defaults like Heroicons.
- **Carries the brand “diamond facet”** motif where applicable — scan, badge, chain, contract, portal all reference the same internal diamond shape that lives in the logomark.

Catalog:

FILE	CONCEPT
<code>shield.svg</code>	Brand mark (also used as bullet asset).
<code>diamond.svg</code>	Pure brand motif — tilted square + facet.
<code>scan.svg</code>	Scan / search.
<code>patch.svg</code>	Auto-fix / wrench.
<code>sparkle.svg</code>	AI augmentation.
<code>lock.svg</code>	Privacy / airgap.
<code>badge.svg</code>	Compliance evidence / rosette.
<code>graph.svg</code>	Telemetry / score / trend.
<code>terminal.svg</code>	CLI / command-line.
<code>book.svg</code>	Catalog / docs.
<code>chain.svg</code>	Cross-chain / interlocked.
<code>clock.svg</code>	Timelock / time-based control.
<code>puzzle.svg</code>	Integrations / fit-together.
<code>portal.svg</code>	Customer / admin portal.
<code>threat.svg</code>	Threat intel / radar.
<code>contract.svg</code>	Smart contract / scroll.

The set is deliberately small. Pages that need an icon for a concept not in the set get a new icon authored to fit the family — they do not pull from third-party libraries.

Brand mark (logomark + wordmark)

The logomark composes three layers:

1. A **navy shield** outline (`#0B1F3A`) — the security-tool semantic.
2. An **emerald diamond** with an internal facet — the brand motif that recurs across the icon set.
3. A **white check tick** across the inner facet — the “Check” in Preston-Check, drawn boldly enough to read at favicon size.

The wordmark renders the logomark at 0.66× scale plus “Preston-Check” in a 26px serif. The middle dot is emerald to echo the diamond. SVG-native text is used (not an outlined path) so the wordmark scales without aliasing and stays editable.

The hero **score badge** (`assets/score-badge.svg`) is a 280×280 ring with a calibrated 87% emerald arc and the letter grade “A–” in a 120px serif. It demonstrates the score-as-headline UX pattern in the very first viewport — a developer landing on the page sees what the scanner produces before reading any copy.

Page architecture

The landing page is a long-scroll, eight-section narrative. Each section serves a single rhetorical purpose; transitions are driven by 1px hairline rules rather than dramatic background flips, so the page reads as one continuous artifact rather than a stack of cards.

1. **Hero** — name, value proposition, instant install command, hero score badge. Goal: the visitor knows in seven seconds what this tool does and how to start using it.
2. **Pillars** — three commitments that differentiate Preston-Check from generic scanners (open scanner / AI-augmented / privacy first). Goal: address the three competing-tool objections at once.
3. **Terminal** — verbatim sample output. Goal: developers who skip marketing copy and want to see the thing actually working.
4. **Features grid** — nine concrete capabilities, each with a custom icon and a one-sentence description. Goal: scannable depth.
5. **Frameworks** — full pill-strip of all 33 frameworks, with the five most fintech-relevant emphasized in emerald. Goal: convince the compliance-minded buyer that the catalog is real.
6. **Pricing** — three-tier table (Free / Pro / Enterprise). Goal: honest pricing without dark patterns; “Most fintechs” ribbon on the Pro tier where the conversion is.
7. **Origin story** — the Preston X narrative + four headline stats. Goal: a story that makes the tool feel earned. Stories travel further than feature lists.
8. **Final CTA + footer** — one more clear ask, plus a footer with product / resources / company columns and a colophon noting the proprietary icon set.

Content tone

Sentences with subjects and verbs. No headline-speak. No hero copy that reads “Empower your DevSecOps to harness the power of AI-driven security at scale” — that style mistakes vagueness for credibility.

The hero h1 is one declarative sentence with a strong verb and a specific object: “*Pre-deployment security audits for fintech that **actually catch the bugs that ship money to attackers.***” That is the tool’s job. The rest of the page proves it.

Deployment

Three options, in order of preference:

1. **Cloudflare Pages** — point at `web/landing/` as the build dir. Free tier, global edge, instant cache invalidation. Wire DNS for `preston-check.com` apex + `www`.
2. **GitHub Pages** — `web/landing/` as the source folder. Slower cache invalidation, but free and zero infrastructure.
3. **Static-hosting any provider** — Netlify, Vercel, S3+CloudFront, Bunny CDN. The build is literally three folders of static files.

For previewing locally:

```
cd web/landing && python3 -m http.server 8080
# open http://localhost:8080/
```

No build step required. No bundler. No package.json. The whole site is reviewable in a single browser tab and git diff is human-readable.

Future surfaces

Pages not yet built that should follow the same design system:

- `/docs` — auto-generated from the markdown in `docs/`. Recommended renderer: Cloudflare Pages + a small markdown-to-HTML step (`pandoc -t html5 --template=docs.html`).
- `/changelog` — render `CHANGELOG.md` directly into a styled page. Same template as docs.
- `/state-of-fintech-security` — annual report landing. Headline statistics in a hero band, then the report as embedded PDF
 - extracted highlights.

- `/blog` — for engineering and security-research posts. Same visual system, single-column long-form layout.

The design system in `styles.css` is the contract. Every additional page must consume the same tokens and reuse the same icon set. New concepts get new proprietary icons authored to fit the family — never imported.
